School of Computer Science and Mathematics

Assessment Brief

Module	CSC-40038
Assessment Component	1 - 3
Weighting	SCRUM Diaries: 25% Group project and report: 50% Personal Reflection: 25%
Deadline	SCRUM Diaries: Weekly for weeks 1-5, Friday 13:00 Group Project: 29/02/24 13:00 Personal Reflection: 14/03/2024 13:00
Module Leader	James Rooney

1. What is the task for this assessment?

Project specification - Forecasting Conference Registrations

The objective of the project is to see if we can forecast the number of final registrations for a conference based on the way the registrations are being made prior to the stat date of the conference.

As an example, if the registration period is sixteen weeks long can we reliably forecast the final number of registrations at the end of week three and week 10 or at any other point based on the registrations to date?

The business objective is to help decide if and when additional advertising is required to reach our target attendance levels.

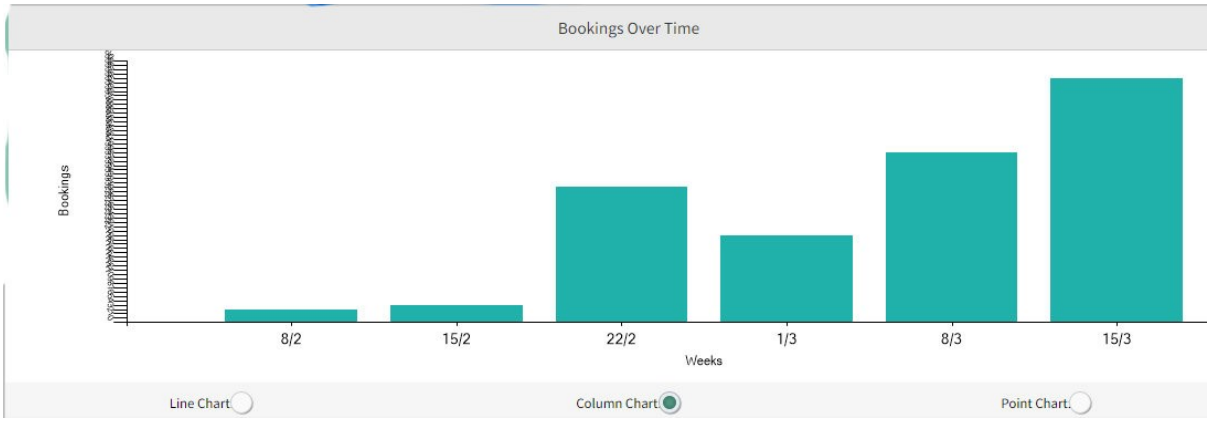

It is important to realise that the target attendance levels are, to say the least, flexible. So they should not be set in stone. Rather to use the data and devise a way that would predict what the final numbers of registrations will be if nothing else changes.

All of the data sets are for similar conferences although they are aimed at slightly different target groups.

Initially the conference would have been promoted with an email campaign and it is likely that some (possibly) all of them had additional email campaigns during the registration period which will have led to an uplift in registrations.

You can assume that the initial marketing efforts were sent out 2 days before the first registration for each event.

Name	Event start date	Target Audience
D19	19/11/2019	IT Managers
D21	09/12/2021	IT Managers
GP21	22/04/2021	Property Managers
MSE21	24/03/2021	Education property managers
NP21	09/11/2021	Property Managers
SRM22	15/06/2022	Education Managers
SRM23	08/06/2023	Education Managers

Assessment details

Part 1: SCRUM Diaries – 25%

- Your team is required to complete the weekly Scrum Roles and Diary template each week throughout this Teamwork Assessment Component. 1 diary is due for submission in each of weeks 1-5. Diary submission information is on the diary
- A template is available on the KLE. The diary must be uploaded to the KLE for your team no later than Friday 1300 of the relevant week.
- There is a word template on the KLE: copy the template to your team's area, and name it with the current week number.
- Each week, you extend your diary with the current week's information (you may create a new copy and extend it, or just change the name and extend it, depending on what is useful for your team)
- You get the diary marks IF, for each required week, your diary is (a) there and clearly named as the current week's diary; (b) appropriately completed; and (c) shows appropriate use of Scrum and evidence of rotation of roles.
- There is information in the teamworking and Scrum directed reading about the purpose of the diaries

Part 2: Group Project – 50%

Final presentation of project – 20%

The group submission should simply involve the uploading of the following components to Blackboard. All components are expected, with the final application being more heavily weighted than other components. For each component the following things will be looked for:

- Compliance with brief and client requirements
- Completeness
- Correctness

a) Final Application (15%)
The code for the final application should be uploaded, and either an executable file or a link to a web version of the application (depending on the nature of the application). This code should be commented, well-structured and use standard variable/method/class/function naming paradigms.

What form the final application takes however is up to you as the group. As long as it meets the requirements as set by the client, this could take the form of a website, python application or notebook, excel spreadsheet or even a straight report and presentation.

b) Group presentation (5%)
The group will also present/demo the application to the marker and client following submission. This will be a chance for you to describe your project to the client and go through any results or findings and detail the reasons for them. There will be a chance for the client to ask questions about your findings. This should not be an in depth description of the processes used, but rather an overview of the final results. There will be the opportunity for the in depth review to be submitted in the team report submission below.

Team Report – 30%

In this assessment component you will expand on the final presentation. Your team report should discuss the application created and the different roles and contributions
Both textual and non-textual (diagrams, flowcharts, screen shots, design mocks up, tables, graphs, code snippets, etc.) devices may be used here to address any component of this report. Annotated screenshots and descriptions can be used to back up parts of your report.

This can be used to show how the requirements gathering, client interactions, software design and/or data processing were ultimately used to produce the final application.

A mark breakdown is shown below with some suggestions for the sorts of content that might be included. This is not an exhaustive list, and not all of the suggestions will be relevant to every project.

a) User documentation (5%)

- A document outlining how to use the various functions of the application should be created.
- Documentation could also be included in the application itself.

b) Technical documentation (5%)

- A document outlining how each aspect/functional component of the application works should be created in order to enable any future developers to easily understand how the application functions.
- This document need not include the application code (which should instead be included as part of the final application itself). Instead this document should include

technical diagrams, flowcharts, screen shots, and any other useful textual or not textual device for conveying the technical makeup of the application.
- Documentation could also be included in the application itself.
- Documentation regarding how to run the application in the first place. Include libraries, and any other software required or setup steps.

c) Client Interactions and Requirements Gathering (5%)
- How client interactions were arranged and for which purposes?
- What methods and techniques were applied to requirements gathering, including the rationale and justification for using these methods and techniques?
- What were the results of the requirements gathering and initial client interaction processes which were then actioned as part of the application's design and ultimate implementation?
- Were any of the initial assumptions about the original project incorrect and clarified through interactions with the client?

d) Software design and user interactions (5%)
- Which design methods and techniques were applied to transfer requirements into a design ready for implementation?
- What factors were taken into account when producing user interfaces and user facing aspects of the applications?
- Are all design and interaction designs justified and necessary?

e) Software and interface implementation (5%)
- Were design documents used effectively to enable an efficient implementation?
- Were any changes made from the design stage during implementation and why?
- Which technologies and resources were used to implement the final application?
- Was the software implemented in a way that took security, portability, and future development into account (where necessary)?

f) Evaluation and testing of finished product (5%)
- Are the criteria used for evaluation appropriate?
- Is the evaluation thorough and complete?
- Were appropriate evaluation and testing techniques used?
- What were the results of any evaluation and testing (and were changes made to the final application as a result of evaluation and testing)?
- Did the final application meet the client requirements? How did they do this?
- In what ways (if any) did the final application exceed the client requirements and expectations?

Team report should not exceed 3000 words
Diagrams, Captions, Footnotes, References and Appendices do not contribute to the final word count.

Part 3: Personal Reflection – 25%

Your personal reflection should reflect on your experience undertaking this collaborative application development project and critically assess your role as part of the development team.

Both textual and non-textual (diagrams, flowcharts, screen shots, design mocks up, tables, graphs, code snippets …) devices may be used here to address any component of this personal reflection.
Your personal reflection will be marked against the following aspects, each aspect/component contributes equally to the final mark for this deliverable:

a) Descriptive (5%)

- Provide appropriate descriptive information about the task and your role within the group to support the reflective elements covered below.

b) Self (5%)

- Reflection on the experience of working in the group, including information such as what could improved next time and how, or what previous experiences shaped experiences during the task.

c) People (5%)

- Reflection on the people in the group including information such as the differing strengths and weaknesses or reasons for these.

d) Organisation (5%)

- Reflection on the organisation of the group including information such as whether they had a leader, whether the organisational strategy was successful, and how they would change the organisation of groups in the future.

e) Behaviour (5%)

- Reflection on the behaviour of people in the group including (but not limited to) information on identification of issues such as conflicts or absent group members, and then discuss how any issues were or might have been remedied. If no issues occurred, what did the group do that had this effect?

Personal reflections should not exceed 1500 words.
Diagrams, Captions, Footnotes, References and Appendices do not contribute to the final word count.

Penalties related to Teamwork during the semester

Teamwork is not an opportunity to chill at the expense of others. An individual who does not contribute adequately to a team will be subject to **mark penalties**.

If you do not participate in team activities, you will get zero for this module, regardless of any individual submission. Inadequate teamwork participation will result in downward adjustment of your overall mark.

Due to the groupwork nature of the module, **parts 1 and 2 (SCRUM diaries and team submission) are NOT eligible for an automatic 7 day extension**. The meetings with Gerard are booked months in advance and cannot be moved.

Exceptional circumstances

● Exceptional circumstances can be submitted by individuals and may lead to another assessment opportunity
● Note that all teams start with 7-8 members but would easily be achievable with 5 team members. If a team member is unavailable for a significant amount of time (e.g. through illness or reported and actioned non-participation), then adjustments may be requested: all requests must be made in a timely manner to the module coordinator, who will determine appropriate adjustments to the reporting requirements, and present the adjustments in a formal email to the team.

Adjustments cannot be made after **week 5**: team software development should be close to being complete at this point ready for the submission in week 6. The sooner a problem is dealt with, the easier to apply any necessary adjustment.
A team that feels that it is suffering from the exceptional circumstances of one or more members should discuss their concerns at the earliest opportunity with the module coordinator, who has the option to adjust requirements and marks as they consider appropriate.

Inadequate participation encompasses many things. Individuals are shown in a timely way to be causing significant problems for other team members are likely to be penalised.

- Examples of demonstrable inadequate participation might be the following:
- Missing teamwork session (sessions that the team has agreed to, and/or timetabled sessions) without good reason.
    - All students may not be able to attend all sessions, but you **must** ensure that your team is aware of your constraints, and you **must** communicate effectively with the other team members.
- Failing to communicate appropriately and effectively with members of the team.
    - Failures of communication are significantly more problematic than physical absence - if you do not keep in touch with your team, and do not communicate appropriately, you will cause problems, even if you are getting on with the work.
- Failing to complete reasonable contributions to team working as determined by the team.

Note that poor performance must be discussed by the team and with the module coordinator in a timely manner. Investigations and adjustments cannot be made retrospectively. In particular, poor engagement or performance reported **after** the end of **week 4** is unlikely to result in investigation or adjustment (substantial investigation is unrealistic in weeks 5 or 6 and cannot take place afterwards).

If anyone feels that their team or teamwork is not going well, they are strongly encouraged to talk to the module coordinator at the earliest opportunity.

You are required to attend all meetings with the client, these should be treated as a client coming in to a company you are working for, asking them to rearrange at the last minute is not feasible. **Not showing up without the prior agreement of the module coordinator and the rest of the team may result in individual mark penalties, although the groupwork project mark itself will be unaffected.**

2. What is required of me in this assessment?

Guidelines	See above for details on completing the different components of the coursework
Self- assessment checklist Make sure that you…	Keep in touch with the other members of your group Ask questions if you do not understand something
Three key pieces of advice based on the feedback given to the previous cohort who completed this assignment	In all cases simply stating that something was done or completed would not be sufficient for a high mark, the reasoning behind why decisions were made and the process leading up to them is just as, if not more, important than the final product. **Document the work you have done**, even any failed approaches you have tried, **and why** you tried them Make sure you are uploading the final version of the project, using an older or non finalised version causes all sorts of problems when it comes to marking! The data being given to you is real data, albeit anonymised. This means there is definitive solution to the problem, it is meant to be an exploration of the data. Make sure you can justify what you have done and most importantly are happy that the results at the end do make sense in context!
Formatting Guidelines	See individual components
Referencing Style	Harvard

3. What is the purpose of this assessment?

The following table shows which of the module learning outcomes are being assessed in this assignment. Use this table to help you see where and how to transfer feedback from one assignment to another. Note that your feedback may mention some of these outcomes, but that you will not receive a 'mark' against each one.

Module Learning Outcomes assessed
Demonstrate their ability to show self direction and originality in working as part of a software development team:
Undertake independent and group activities, and critically evaluate proposals informed by knowledge at the forefront of the discipline
Critically evaluate a typical business problem and apply the relevant skills to deliver a solution for that problem:
Critically evaluate the options and select effective approaches, when dealing with the limited information typically available in the early stages of a project
Critically evaluate both individual and team approaches to the development process and synthesize an appropriate strategy for personal and team improvement

Rationale	This module gives you a feel for how a project might approached in a real company, giving you a chance to work in teams, and deal with the inevitable complexities of working with live data built up over a long period of time

4. What resources might I use to get started?

The teamworking documents on the KLE can be used to get started on organising your group. Ensure you (as a team) are keeping a record of meetings and decisions made relating to the development of the project
